Module Goals

Learn about map queries

Temporary queries

Persistent queries (design documents)

Map Queries

Helps you perform complex queries

Uses the query() API

Temporary

- Index created on-the-fly

Persistent

- Permanent index created

```
db.query(function (doc) {  
    emit(doc._id, doc.serviceDate) ;  
} ) ;
```

The query() API is passed a function used to return data

Document is passed in

Call emit() to provide data

- First parameter is the 'key'
- Second parameter is the 'value'

Demo

A temporary map query

Demo

Just return a key (no value)

Demo

Multiple fields in value parameter

Demo

Return object for value

Design Document

Create persistent query

Builds secondary index

Uses map function

- Write code to include documents
- Use emit() function

Demo

Create design documents

Demo

Search using design document

Filter data using startkey and endkey

Map Query Notes

Mango queries are easier

- Generally they solve 99% of your queries

Avoid temporary queries

- Use persistent queries

The first time you run the query, it is slow

- Builds the index

Summary

Learned to use the `query()` API

Can run them "on-the-fly"

Can create design document

Use persistent over temporary

Use `allDocs()`

- Then `query()` API
- Then `find()` API

Coming up in the next module...

Gather statistics

Learn built-in reduce functions
